1. Marketing & Pricing Dynamics

The Pricing Sweet Spot

- **The Pricing Sweet Spot**

Question: Does higher cost for two correlate with higher rating?

Visual Used: Scatter Plot with Trendline (Cost vs Average Rating)

Key Observation:

The trendline indicates a negative slope relationship between cost for two and rating.

Interpretation:

As cost increases, ratings slightly decline. This suggests that higher pricing does not necessarily lead to better customer satisfaction and may even raise expectations that are harder to meet.

Business Insight:

Premium pricing must be backed by exceptional quality and experience. Restaurants cannot rely solely on higher pricing to signal quality. Value perception plays a critical role in customer ratings.

- **Cost Distribution by Location**

Question: Is Whitefield more expensive than Koramangala?

Visual Used: Clustered Column Chart (Average Cost by Location)

Key Observation:

The average cost for two in Whitefield is ₹1466.36 compared to ₹1331.25 in Koramangala.

Interpretation:

Whitefield appears relatively more premium than Koramangala, likely reflecting differences in customer demographics, commercial infrastructure, and spending capacity.

Business Insight:

Location significantly influences pricing strategy. Restaurants must align their pricing models with the purchasing power and lifestyle of the local population.

Cost Distribution by Location

The Price Of Online Convenience

- **The Price of Online Convenience**

Question: Is there a price difference between restaurants offering online ordering vs not?

Visual Used: Column Chart (Avg Cost by Online Ordering: Yes/No)

Key Observation:

Restaurants offering online ordering have an average cost of ₹1262.44, compared to ₹1394.10 for those that do not.

Interpretation:

Online-enabled restaurants tend to be slightly less expensive, suggesting that digital platforms are often used by mid-range or competitively priced outlets to increase accessibility and volume.

Business Insight:

Online ordering is not restricted to premium dining. Instead, it is leveraged as a growth tool by value-driven restaurants to expand reach and improve order frequency.

The "Hype" Factor

2. Deep Dives into Popularity

• The "Hype" Factor

Question: Do restaurants with high votes have higher ratings?

Visual Used: Scatter Plot (Votes vs Rating)

Key Observation:

A strong upward trend correlation exists between number of votes and rating.

Interpretation:

Higher customer engagement (votes) is generally associated with higher ratings, indicating that restaurants delivering better experiences naturally attract more reviews and visibility.

Business Insight:

Quality and popularity reinforce each other. Positive customer experiences drive engagement, which in turn enhances visibility and brand reputation.

• Cuisine Diversity vs. Rating

Question: Do multi-cuisine restaurants perform better?

Visual Used: Column Chart (Avg Rating by Cuisine Count Category)

Key Observation:

Restaurants serving 3+ cuisines have an average rating of 3.51 compared to 3.47 for single-cuisine restaurants.

Interpretation:

The rating difference is marginal, indicating that offering multiple cuisines does not significantly outperform specialized restaurants.

Business Insight:

Cuisine diversity alone is not a strong differentiator. Restaurants should prioritize quality execution over menu expansion to maintain consistent ratings.

Cuisine Diversity v/s Rating

3. Geographical Trends

The "Foodie" Hubs

- The "Foodie" Hubs**

Question: Which locations have the highest concentration of 4.0+ rated restaurants?

Visual Used: Bar Chart (Count of High-Rated Restaurants by Location)

Key Observation:

Marathahalli has the highest number of restaurants rated 4.0+.

Interpretation:

Marathahalli demonstrates a high concentration of well-rated establishments, indicating strong competition and high customer satisfaction levels within the locality.

Business Insight:

High-rated clusters reflect mature and competitive food ecosystems. Entering such markets requires differentiation and strong value propositions.

- Service Type Availability by Area**

Question: What is the most common service type?

Visual Used: 100% Stacked Bar Chart (Service Type % in Indiranagar)

Key Observation:

Dine-out, pubs, and bars account for the highest percentage of establishments in Indiranagar.

Interpretation:

The area is predominantly focused on experiential and social dining rather than delivery-centric models.

Business Insight:

Indiranagar's restaurant ecosystem is aligned with lifestyle-driven consumption patterns, making it ideal for brands targeting social gatherings and nightlife audiences.

Service Type Availability in Indiranagar

4. Operational Insights

Impact of Table booking on Engagement

- Impact of Table Booking on Engagement**

Question: Do booking-enabled restaurants get more votes?

Visual Used: Column Chart (Average Votes: Booking Yes vs No)

Key Observation:

Restaurants offering table booking receive 1466 average votes compared to 1423 for those that do not.

Interpretation:

The difference in engagement is marginal, suggesting that reservation availability does not significantly influence customer review volume.

Business Insight:

While booking systems enhance convenience, they are not a primary driver of engagement. Core service quality and visibility remain more influential factors.

- Rating Consistency across Chains**

Question: How much does rating vary across branches?

Visual Used: Standard Deviation Analysis / Rating Spread Chart

Key Observation:

Among top chains, Leon Grill shows the highest rating variability and Nandhana Palace shows the lowest rating variability.

Interpretation:

Some chains demonstrate stronger operational consistency across branches, while others experience noticeable variation in service quality.

Business Insight:

Operational standardization is crucial for brand trust. Chains with lower rating variability are better positioned for long-term scalability and reputation management.

Rating Consistency across chains
